

Ghanashyam D

reachghanashyamd1@gmail.com | [GitHub](#) | [LinkedIn](#) | [Portfolio](#)

SUMMARY

Full Stack Developer with experience building end-to-end systems combining backend services, data processing, and machine learning. Comfortable designing APIs, structuring workflows, and translating problem statements into maintainable systems. Focused on clean code, modular design, and improving system-level thinking.

SKILLS

Languages: JavaScript, Python, C++, Java

Frontend: React.js, Tailwind CSS

Backend: Node.js, Express.js, Flask

Databases: PostgreSQL, MongoDB

ML: Scikit-learn, Pandas, NumPy

Tools: Docker, AWS (EC2), Git, GitHub

Concepts: REST API Design, MVC Architecture, JWT Authentication, System Design

PROJECTS

FraudGuard — Transaction Monitoring System

[GitHub](#)

- Designed a backend-driven system to process transaction streams and detect anomalous patterns in near real-time.
- Integrated a machine learning model to detect anomalous behavior patterns.
- Built REST APIs using Node.js and Express for ingestion, processing, and prediction pipelines.
- Developed a React dashboard to visualize transaction flows and risk indicators.
- Used PostgreSQL for structured storage and Docker for containerized deployment on AWS EC2.
- Structured the system with modular components to support scalability and future enhancements.

Intelligent Learning Path Generator

- Designed and implemented a full-stack system that generates structured learning roadmaps based on user goals and current skill levels.
- Built rule-based recommendation logic to map skills to prerequisite concepts and sequence topics into coherent learning paths.
- Developed RESTful APIs using Node.js and Express for roadmap generation, persistence, and user-specific data retrieval.
- Modeled topic relationships, learning resources, and user progress using MongoDB to support flexible data structures.
- Built a React-based interface for goal input, roadmap visualization, and progress tracking.
- Deployed the application with backend services on Render and frontend on Vercel.

System Design Project

- Designed a backend-focused system emphasizing scalability and structured data flow.
- Explored API design, database modeling, and system trade-offs.
- Applied system design principles to build a practical, extensible solution.
- Evaluated architectural decisions based on performance and maintainability.

EDUCATION

JSS Science and Technology University, Mysuru

May 2026

B.E. in Computer Science and Engineering — CGPA: 8.68/10

Vijaya Vitthala Composite PU College, Mysuru

May 2021

Senior Secondary (PUC) — 97.5%

Kautilya Vidyalaya, Mysuru

May 2019

Secondary (SSLC) — 91.2%

TECHNICAL HIGHLIGHTS

- Built and deployed full-stack systems with emphasis on backend architecture and data flow.
- Strong focus on clean code, modular design, and maintainability.
- Experience integrating machine learning components into application workflows.
- Strong interest in system design, backend scalability, and real-world problem solving.
